Read Me:

To get the RNDM app finished source code up and running like you saw in the course, (assuming you have not created your own project and already followed along in the videos) you first need to add your own GoogleService-Info.plist to the project.

To do so, follow these steps as shown in the course:
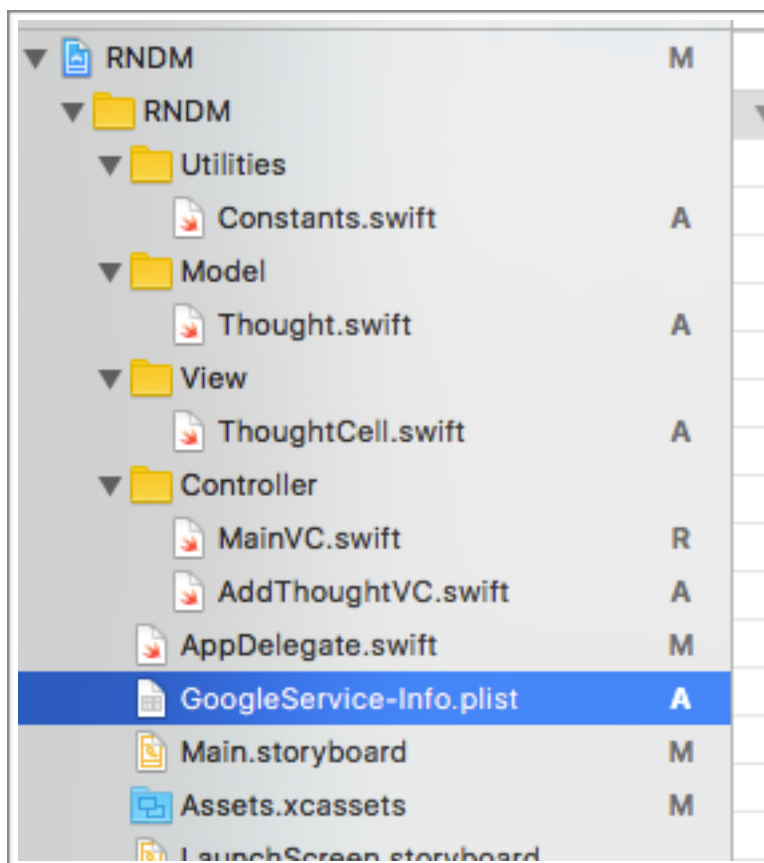

Go to https://console.firebase.google.com
Click on the 'Add project' button and give your project a name and select a region.
The project will build and then you will be taken to the dashboard.
Click on the 'Add an app' button and select iOS.

Follow the steps in the wizard:

1) Enter the the iOS bundle id which is : com.jonnyb.RNDM. Nickname and app store id are optional.
2) In step 2 download the config file, and once it is downloaded, drag it into your project as shown here:

With the GoogleService-Info.plist file selected, ensure that the target membership is set in the right hand pane:

You can just click through continue on steps 3 and 4.

Now in the Firebase console, in the left hand pane, click on Database, and select the Firestore option. When it asks you for security rules, select the Test Mode option.

You should now be good to go! Run the app and try adding some thoughts and see if it shows up in your database.

HAPPY CODING!
